

Ex.no:6C	DATA VISUALIZATION USING POWER BI (HEALTHCARE ANALYTICS - LIFE EXPECTANCY DATASET)

Aim:

To clean, preprocess, and transform the Life Expectancy Data.csv dataset, load the clean data model into Power BI, and build an interactive visual dashboard to analyze Life expectancy, development status, yearly trends, and schooling.

Algorithm:

Steps:

1. Import Dataset:

Load Life Expectancy Data.csv into Power BI.

2. Data Inspection:

Identify the columns, data types, missing values, and duplicate records.

3. Data Cleaning

Remove duplicate rows and handle missing values in Life expectancy and other required fields.

4. Data Type Handling

Set Year as Whole Number, Life expectancy and other continuous measures as Decimal Number, and Country and Status as Text.

5. Load Clean Data

Load the cleaned Life Expectancy table into Power BI Desktop using Get Data > Text/CSV or Apply & Close from Power Query.

6. Create Core Metric:

Create the measure

Average Life Expectancy = AVERAGE('Life Expectancy Data'[Life expectancy]).

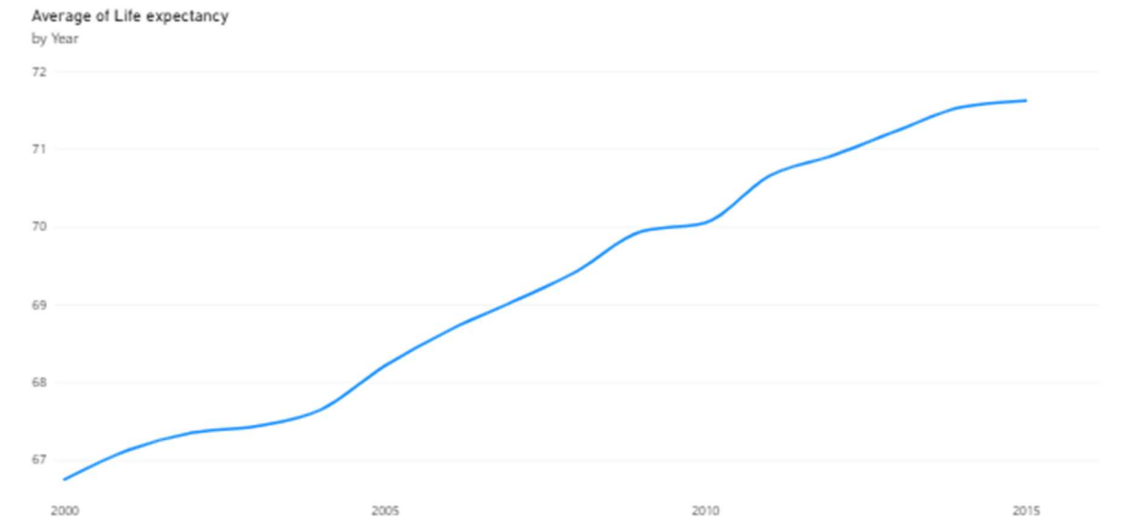

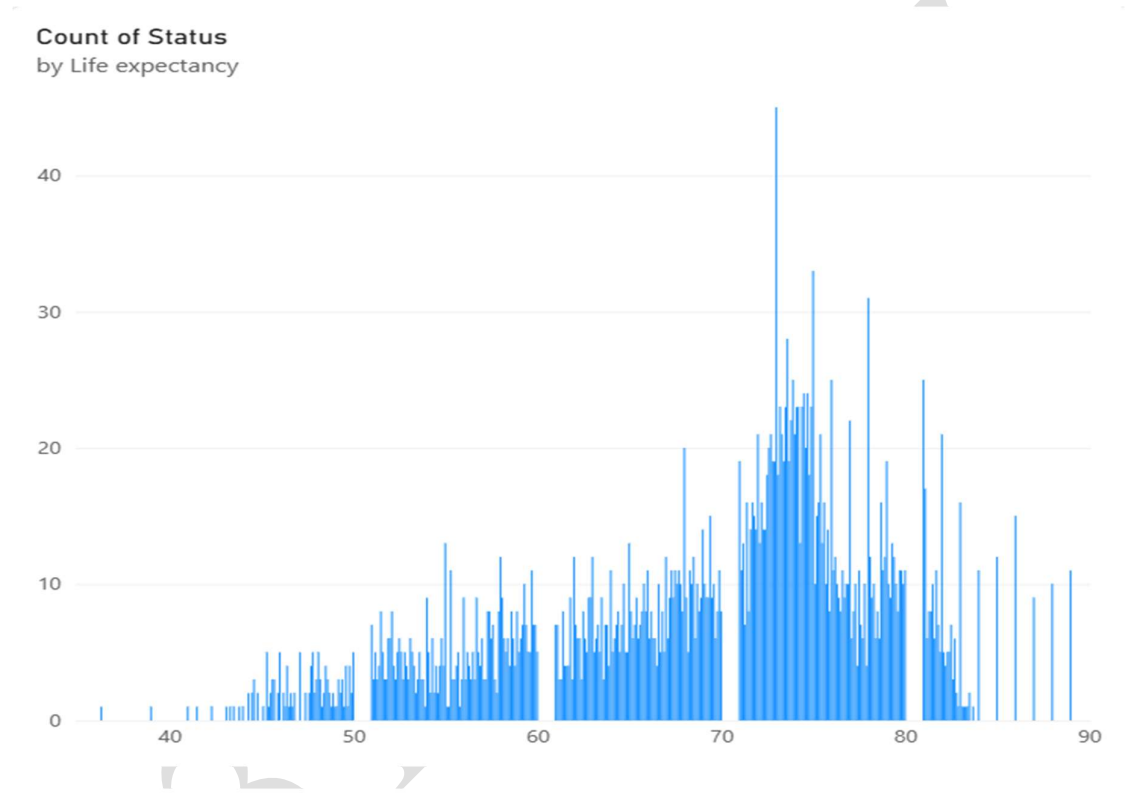

7. Create Visuals:

Build a line chart for Average Life Expectancy by Year and a clustered column chart for Average Life Expectancy by Status.

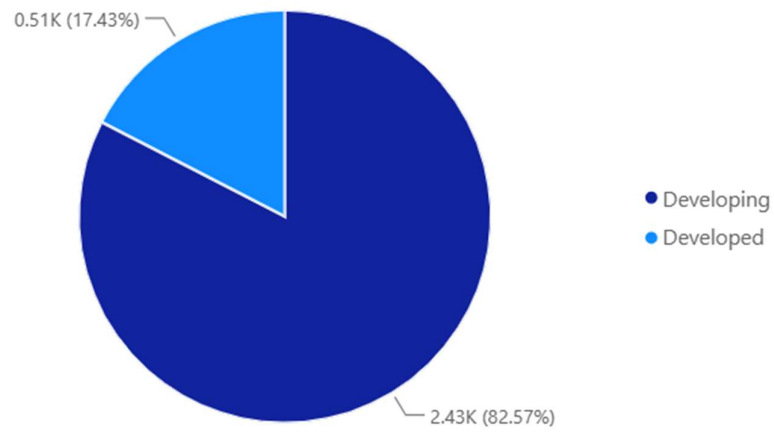

8. Create Additional Visuals:

Build a pie chart for development-status distribution and a scatter chart for Schooling versus Life expectancy.

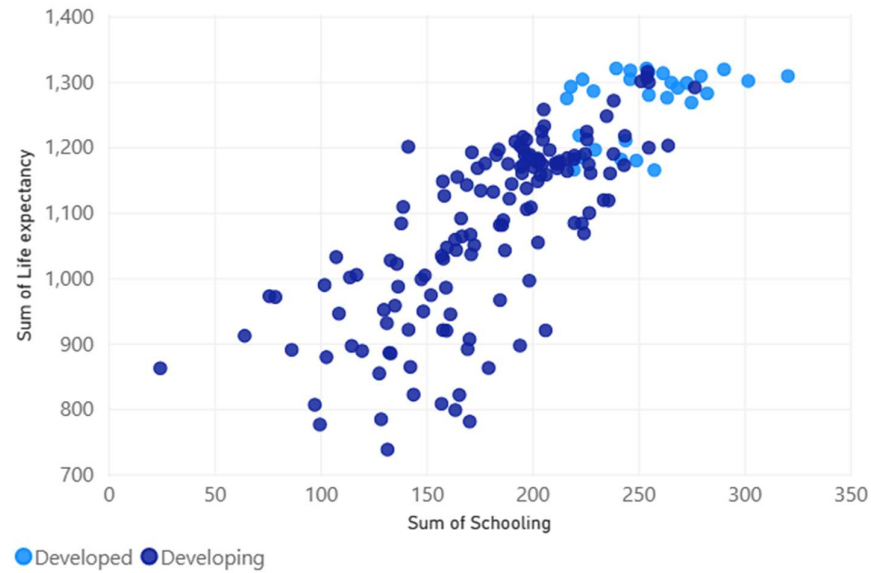

Output:

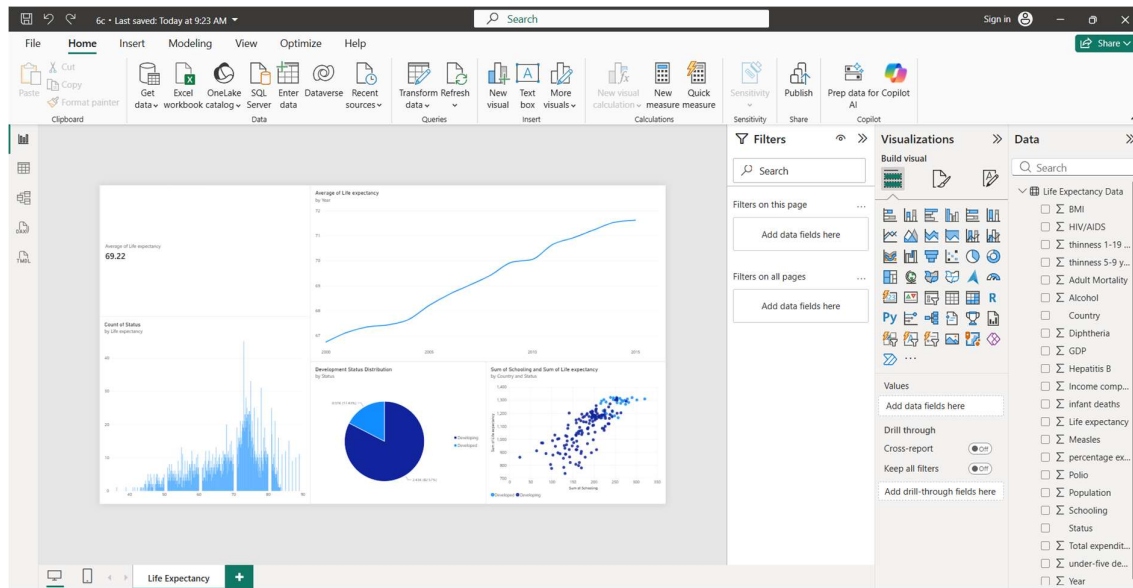

Development Status Distribution
by Status

Sum of Schooling and Sum of Life expectancy
by Country and Status

Result:
